

State Restoration

State Restoration

It's like you never left...

Create Delightful Experiences

State Restoration *It's like you never left...*

#SwiftFest #StateRestoration @ishabazz 

Delightful?

Meet or Exceed Expectations

State Restoration *It's like you never left...*

#SwiftFest #StateRestoration @ishabazz 

Expectations?

Expectations Begin in the Physical World

Object Permanence

State Restoration *It's like you never left...*

#SwiftFest #StateRestoration @ishabazz 

**“The understanding that objects
continue to exist even when they
cannot be perceived.”**

A black and white photograph showing a close-up of a woman's face as she holds a baby. The woman is looking down at the baby with a gentle expression. The baby is wrapped in a thick, textured blanket and is looking up towards the camera. The text "As a Baby" is overlaid in the center of the image.

As a Baby

How can we improve this? 🤔

Adding State Restoration

State Restoration *It's like you never left...*

#SwiftFest #StateRestoration @ishabazz 

3 Requirements

- Opt In to State Preservation
- Assign Restoration Identifiers to Your View Controllers
- Opt In to State Restoration

Opting In to State Preservation

AppDelegate.swift

```
//State Preservation
```

```
func application(_ application: UIApplication, shouldSaveApplicationState coder: NSCoder) -> Bool {  
    return true  
}
```

Assign Restoration Identifiers

- Must be unique
- Must be set on every ViewController in the hierarchy
- Storyboard or Code

Years

Months

Days

Detail

Set Restoration ID

Custom Class

Class  

Module 

☒ Inherit Module From Target

Identity

Storyboard ID

Restoration ID

☐ Use Storyboard ID

Set Restoration ID

The image shows a screenshot of the Xcode interface, specifically the Identity inspector for a storyboard element. It is divided into two sections: 'Custom Class' and 'Identity'. In the 'Custom Class' section, the 'Class' is set to 'TabBarController' and the 'Module' is 'StateRestoration'. The 'Inherit Module From Target' checkbox is checked. In the 'Identity' section, the 'Storyboard ID' is 'tabBarController' and the 'Restoration ID' is also 'tabBarController'. The 'Use Storyboard ID' checkbox is checked and highlighted with a red circle.

Custom Class	
Class	TabBarController
Module	StateRestoration
<input checked="" type="checkbox"/> Inherit Module From Target	

Identity	
Storyboard ID	tabBarController
Restoration ID	tabBarController
<input checked="" type="checkbox"/> Use Storyboard ID	

Set Restoration ID

```
//Manually Set Restoration Identifier  
self.restorationIdentifier = "DetailViewController"
```

Opting In to State Restoration

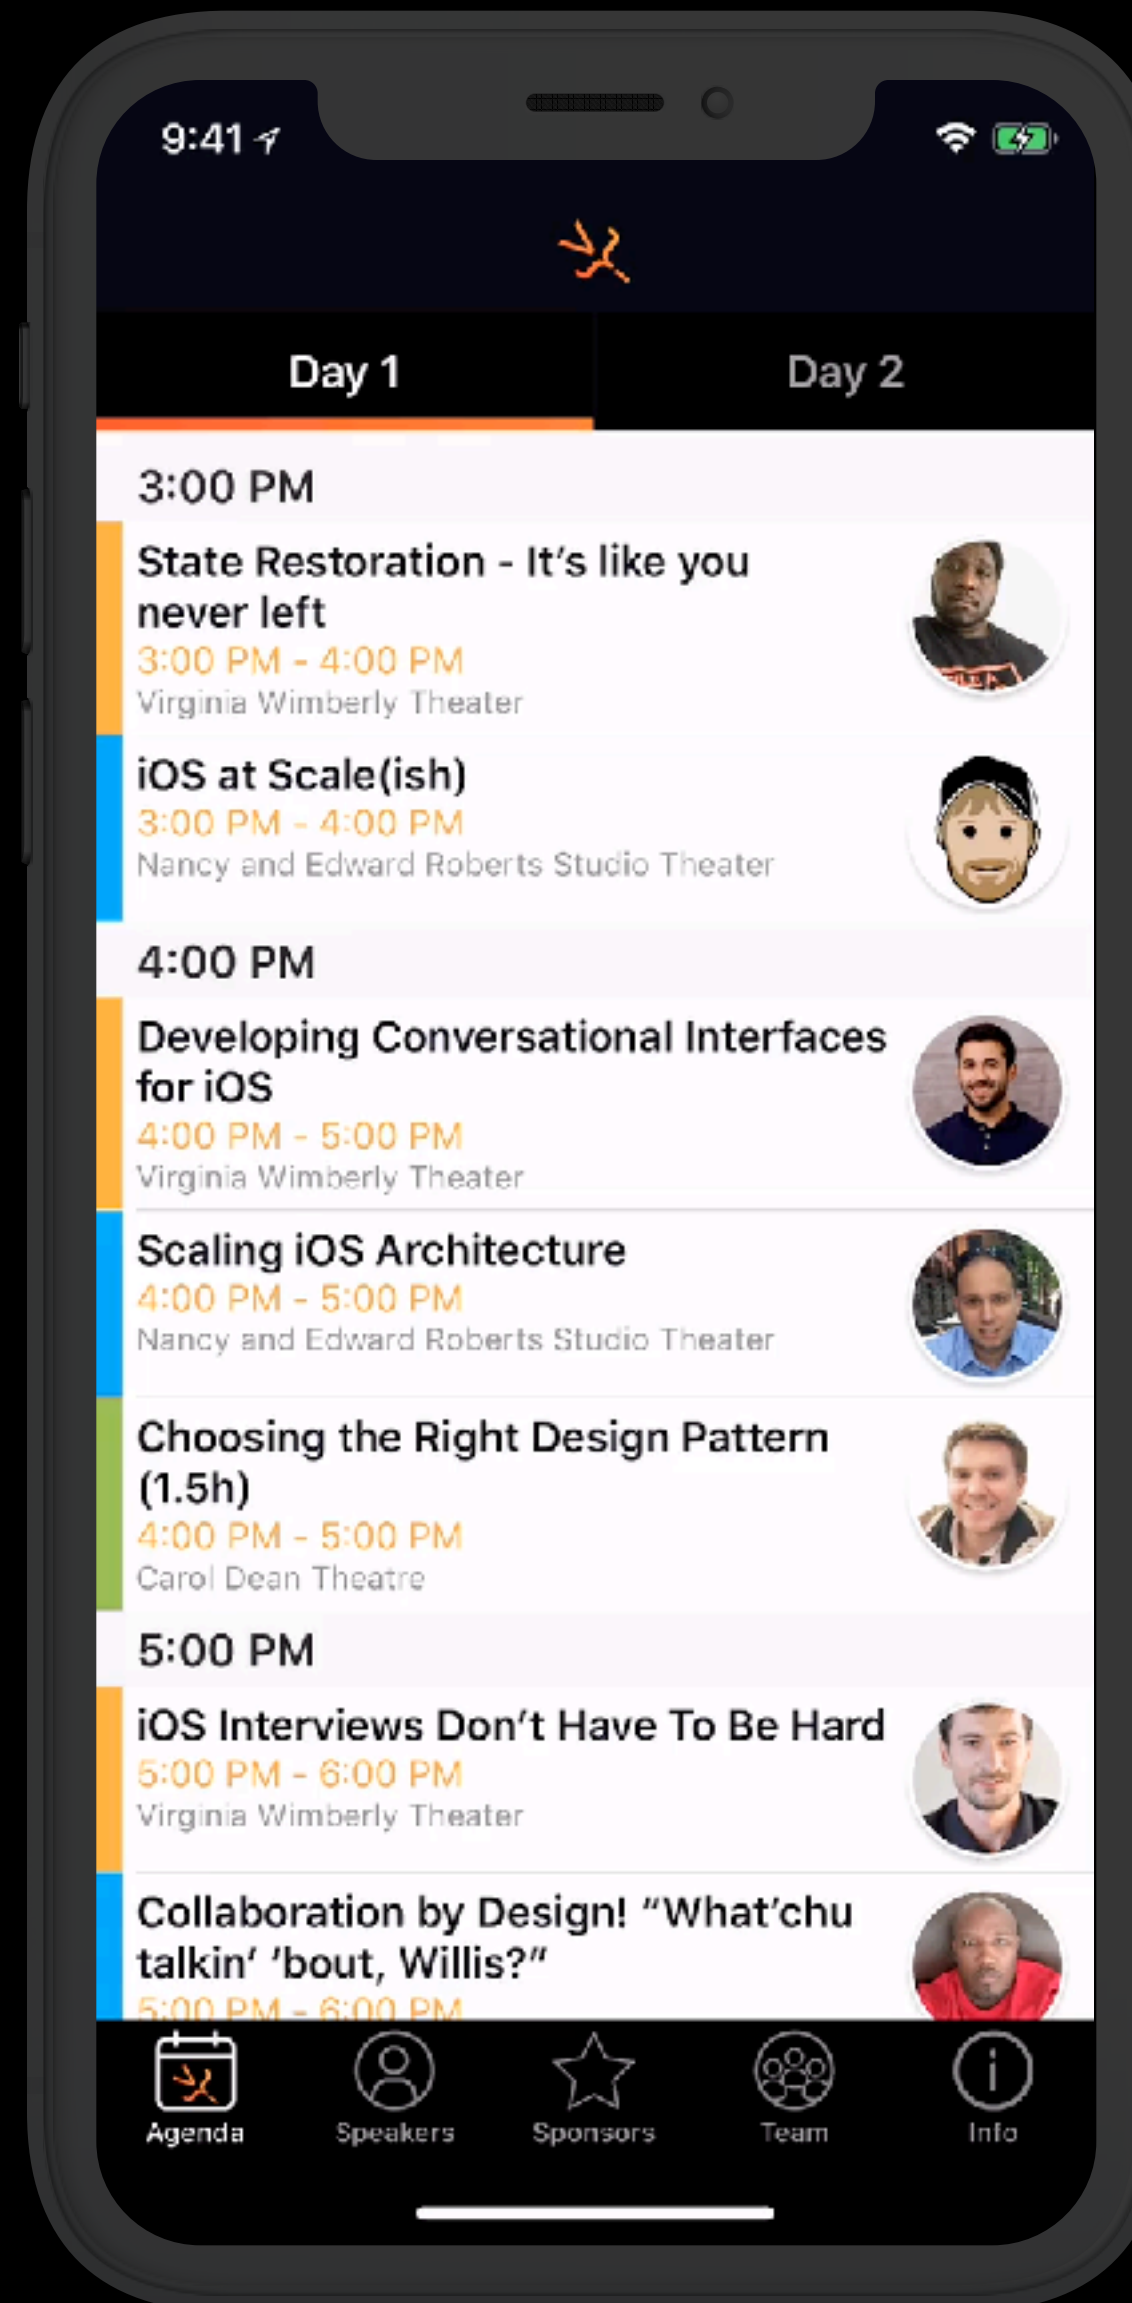

AppDelegate.swift

```
//State Restoration
```

```
func application(_ application: UIApplication, shouldRestoreApplicationState coder: NSCoder) -> Bool {  
    return true  
}
```

Basic State Restoration

What went wrong? 🤔

By Default Data Isn't Preserved

Encode and Decode Custom Information

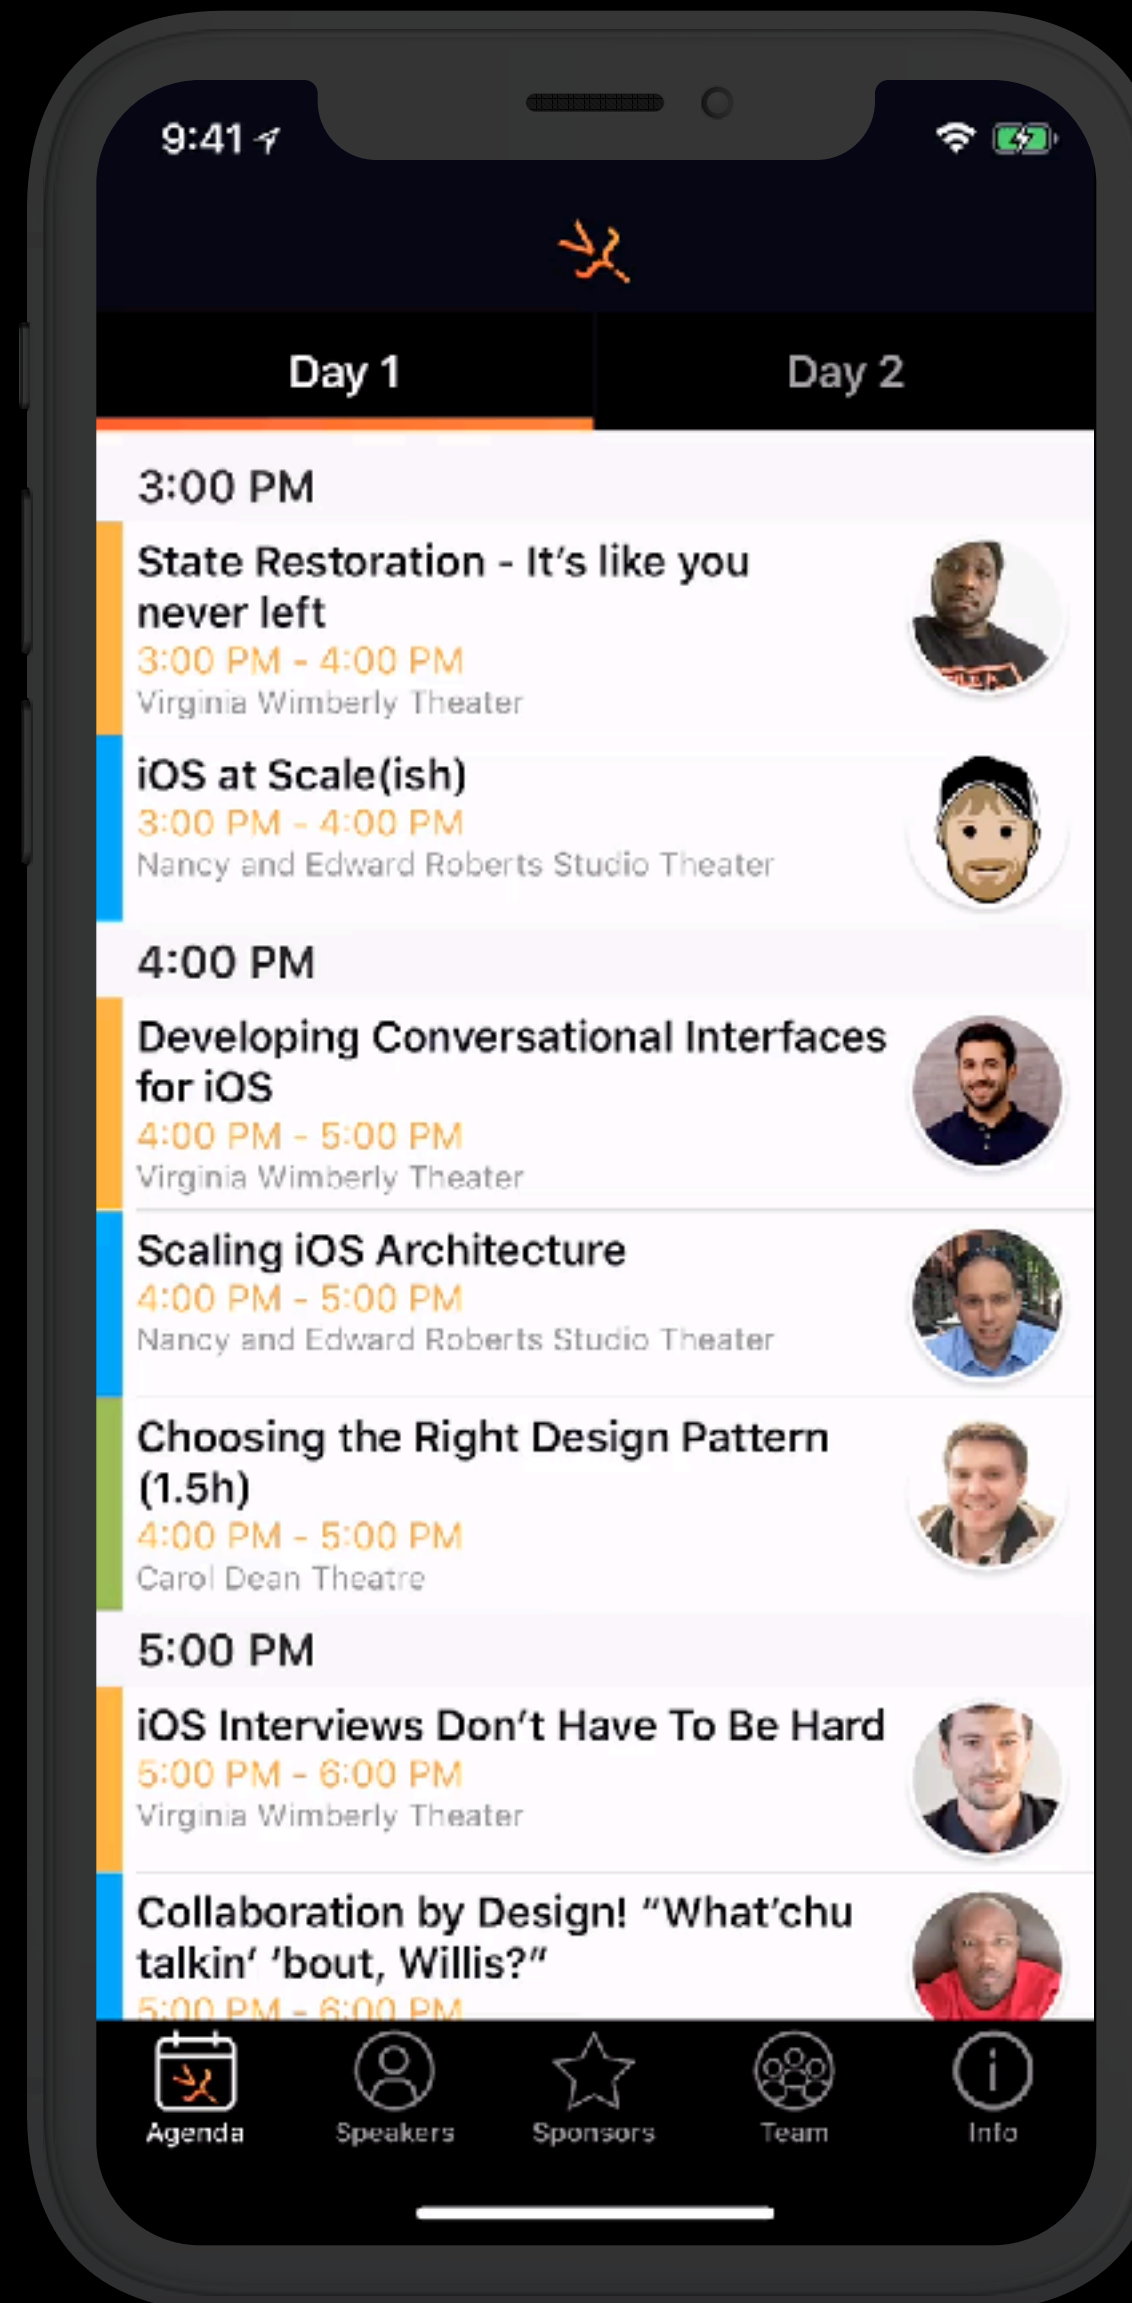

```
//Save Data
override func encodeRestorableState(with coder: NSCoder) {
    super.encodeRestorableState(with: coder)
    //...
}
//Restore Data
override func decodeRestorableState(with coder: NSCoder) {
    super.decodeRestorableState(with: coder)
    //...
}
```

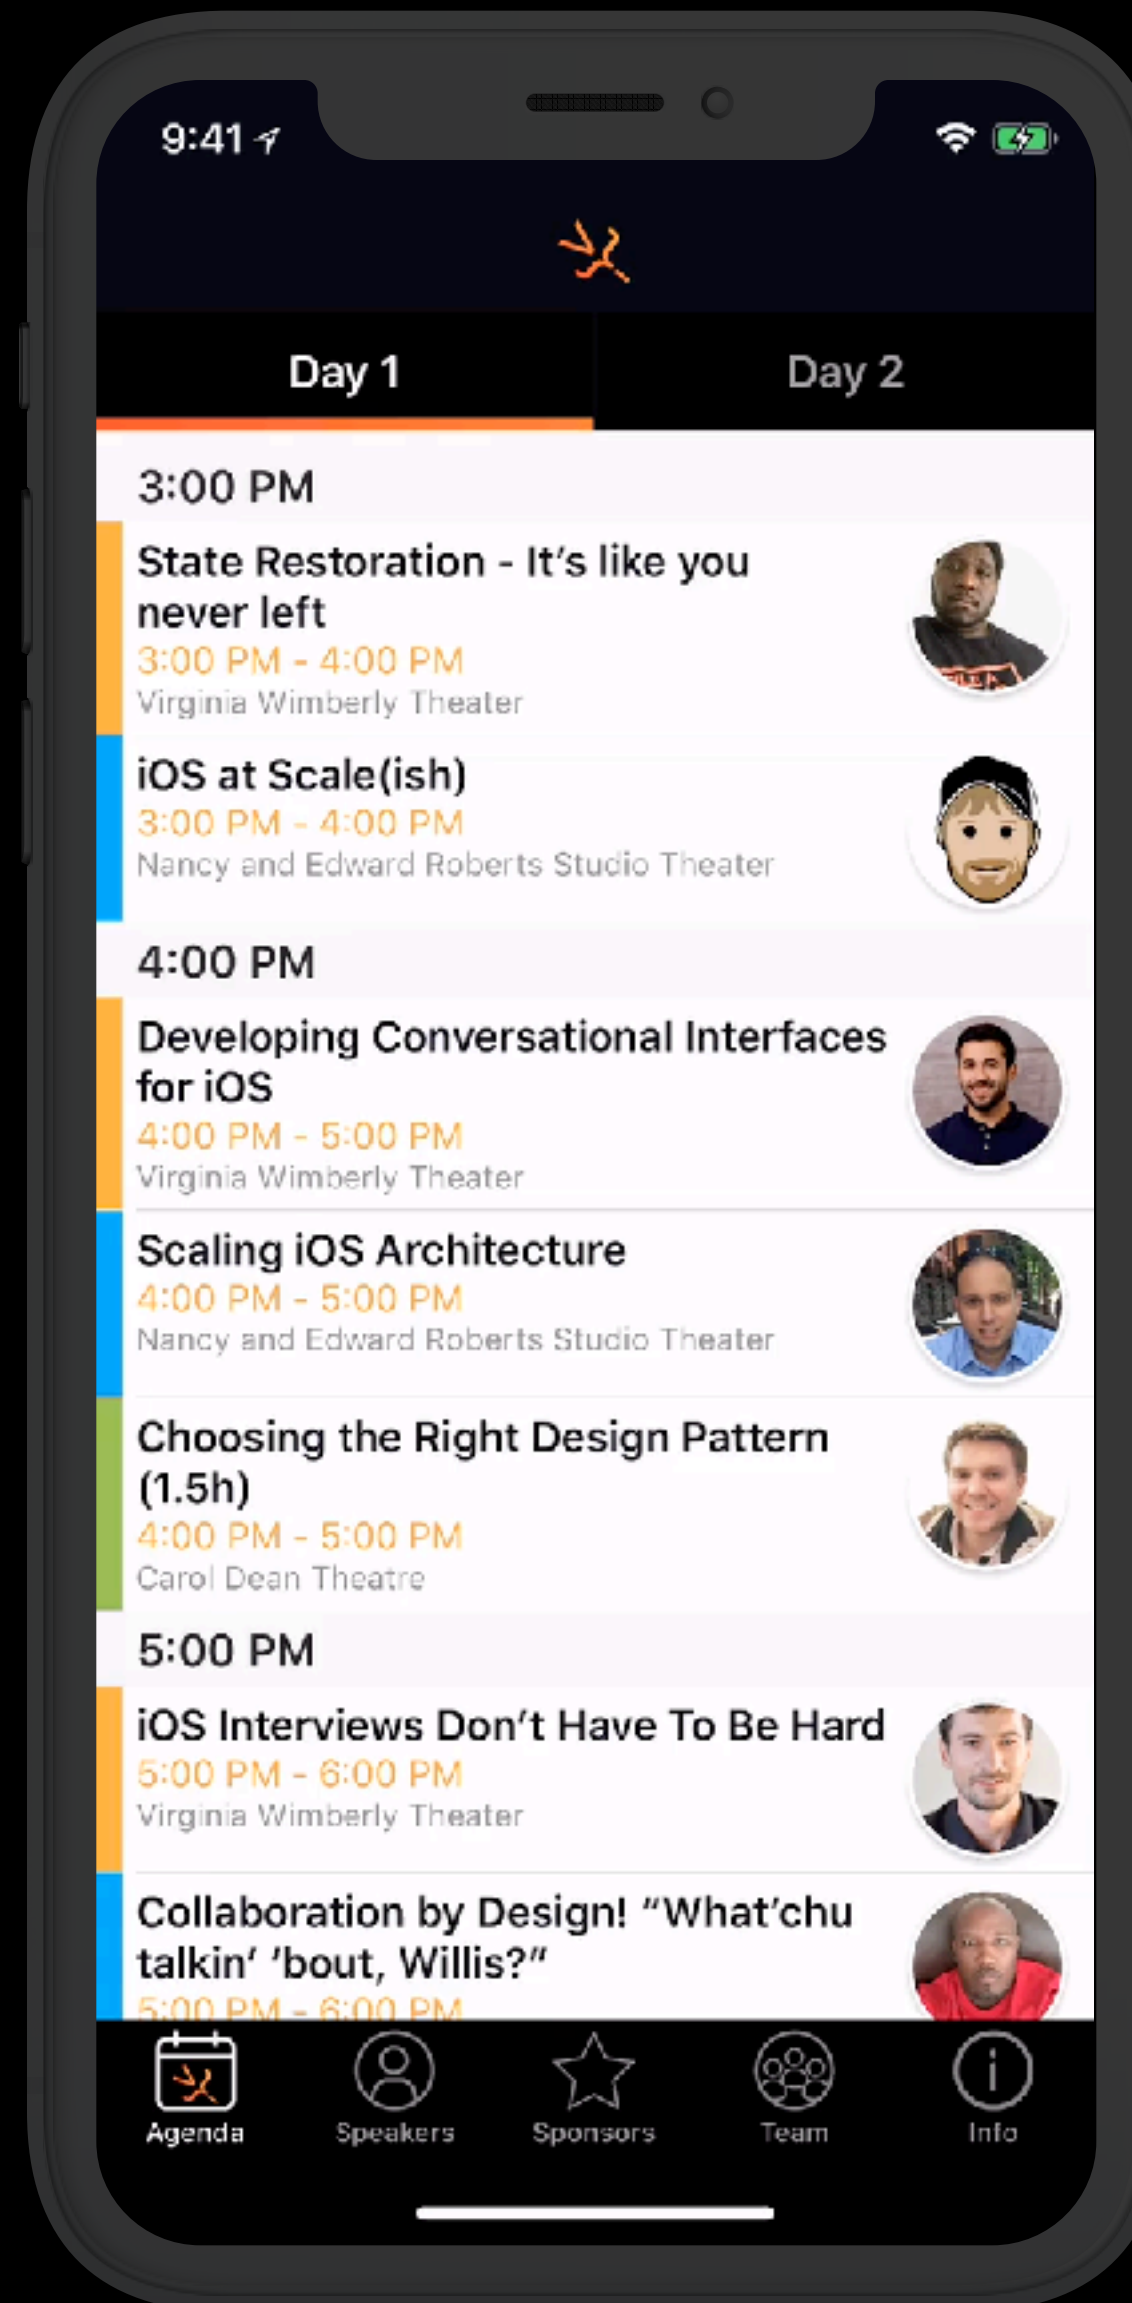

Encoding

- *encodeRestorableState(with:)* is called before app goes to the background
- Don't encode data that belongs in the persistent store
- Don't depend on encoded data. Have a backup plan.

Decoding

- `decodeRestorableState` is called **AFTER** `viewDidLoad()`
- `prepareForSegue()` is called **BEFORE** `viewDidLoad()`

How could it be better? 🤔

Preserving Scroll Position

Preserving Scroll Position

- Set restoration ID on UIScrollView
- Storyboard or Code

Set Restoration ID

```
//Set Restoration Identifier  
self.tableView.restorationIdentifier = "table"
```

Set Restoration ID

Custom Class

Class  

Module 

☐ Inherit Module From Target

Identity

Restoration ID

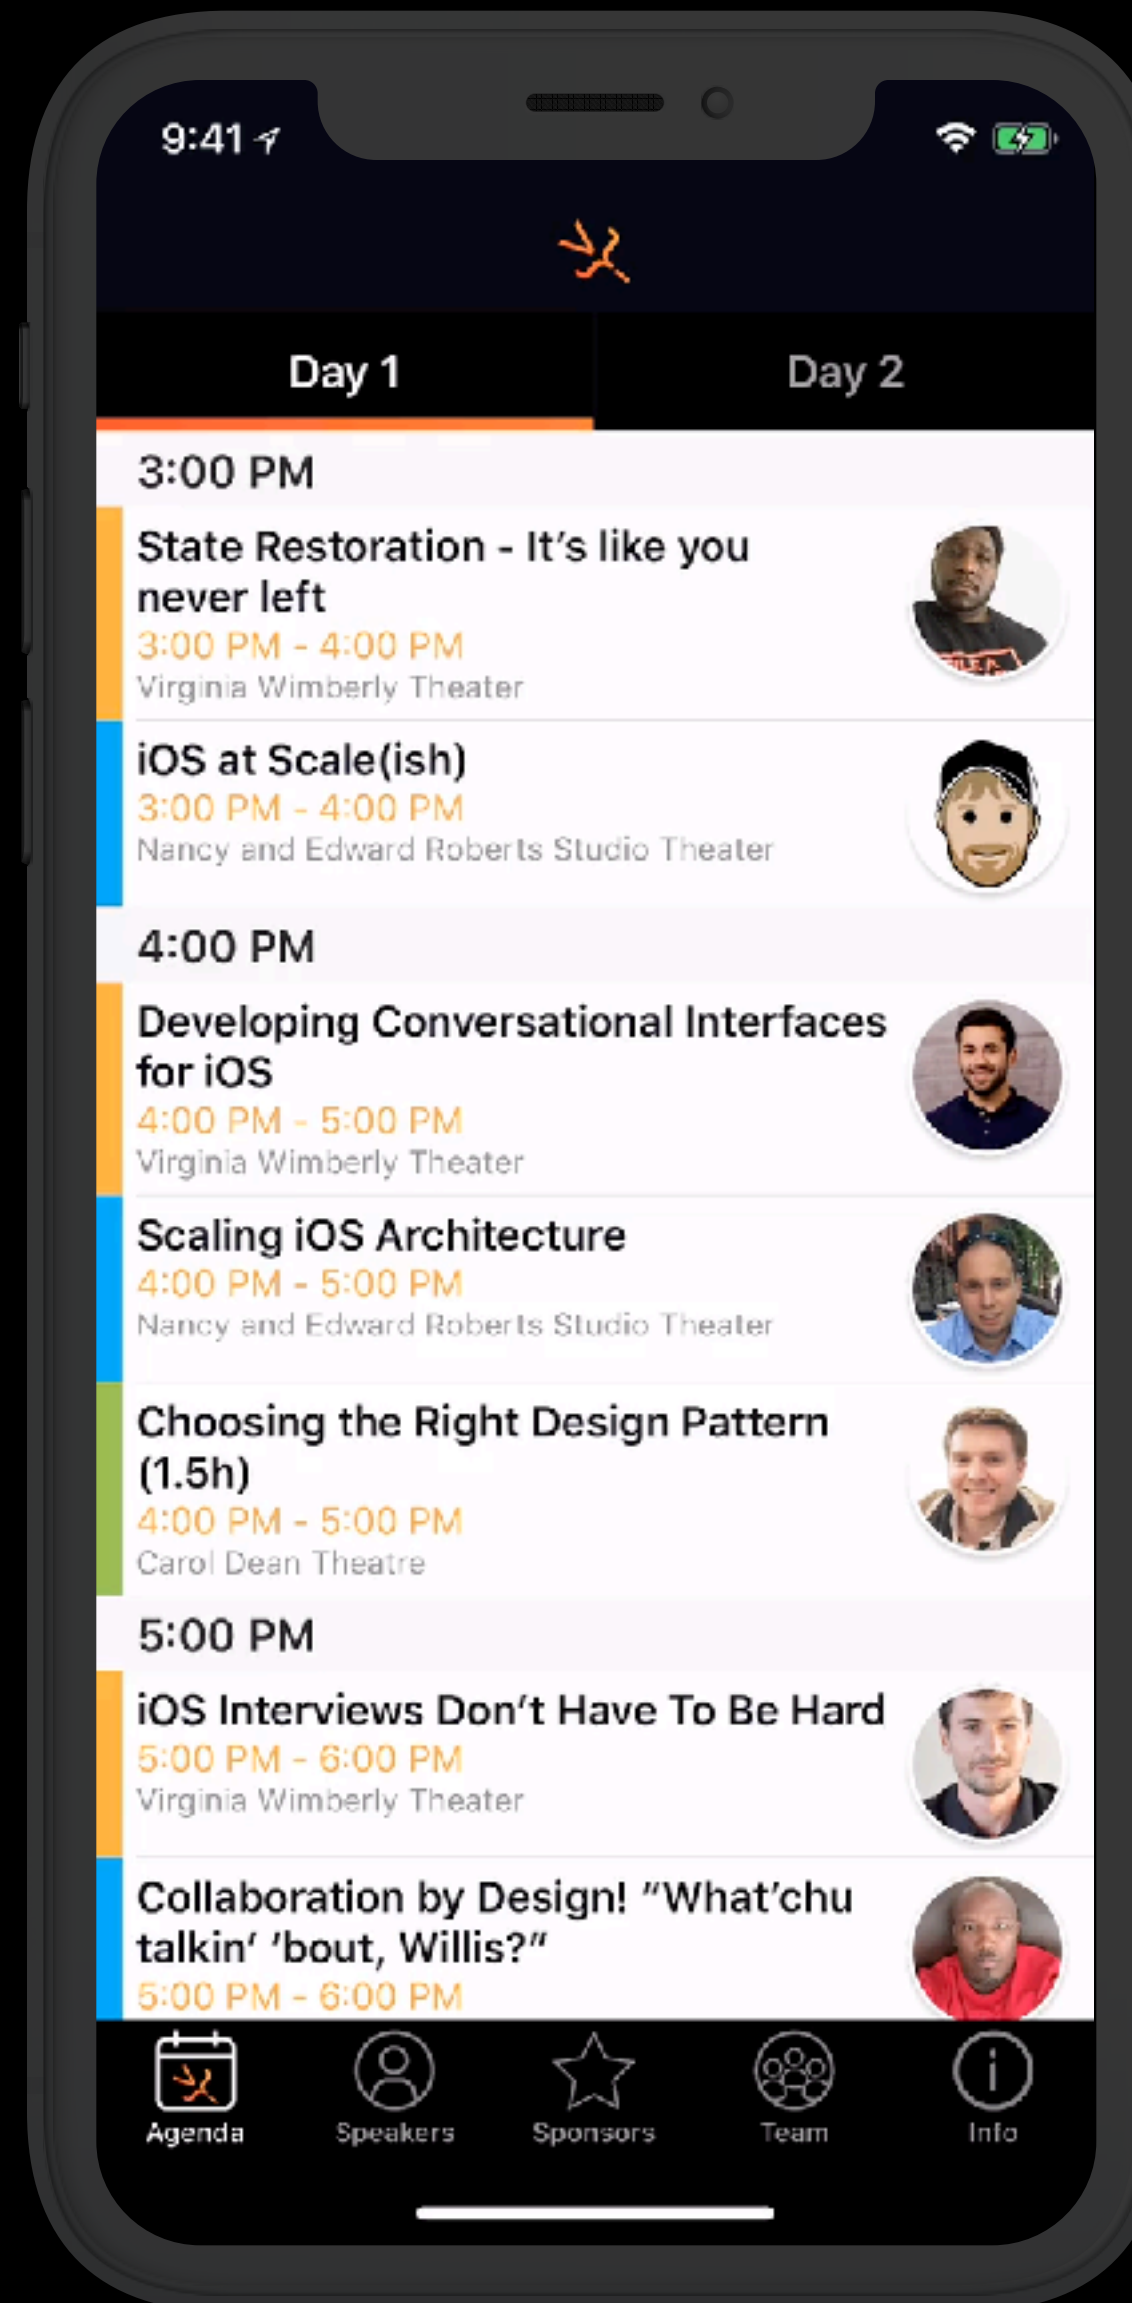

User Defined Runtime Attributes

Key Path	Type	Value
----------	------	-------

UITableView & UICollectionView

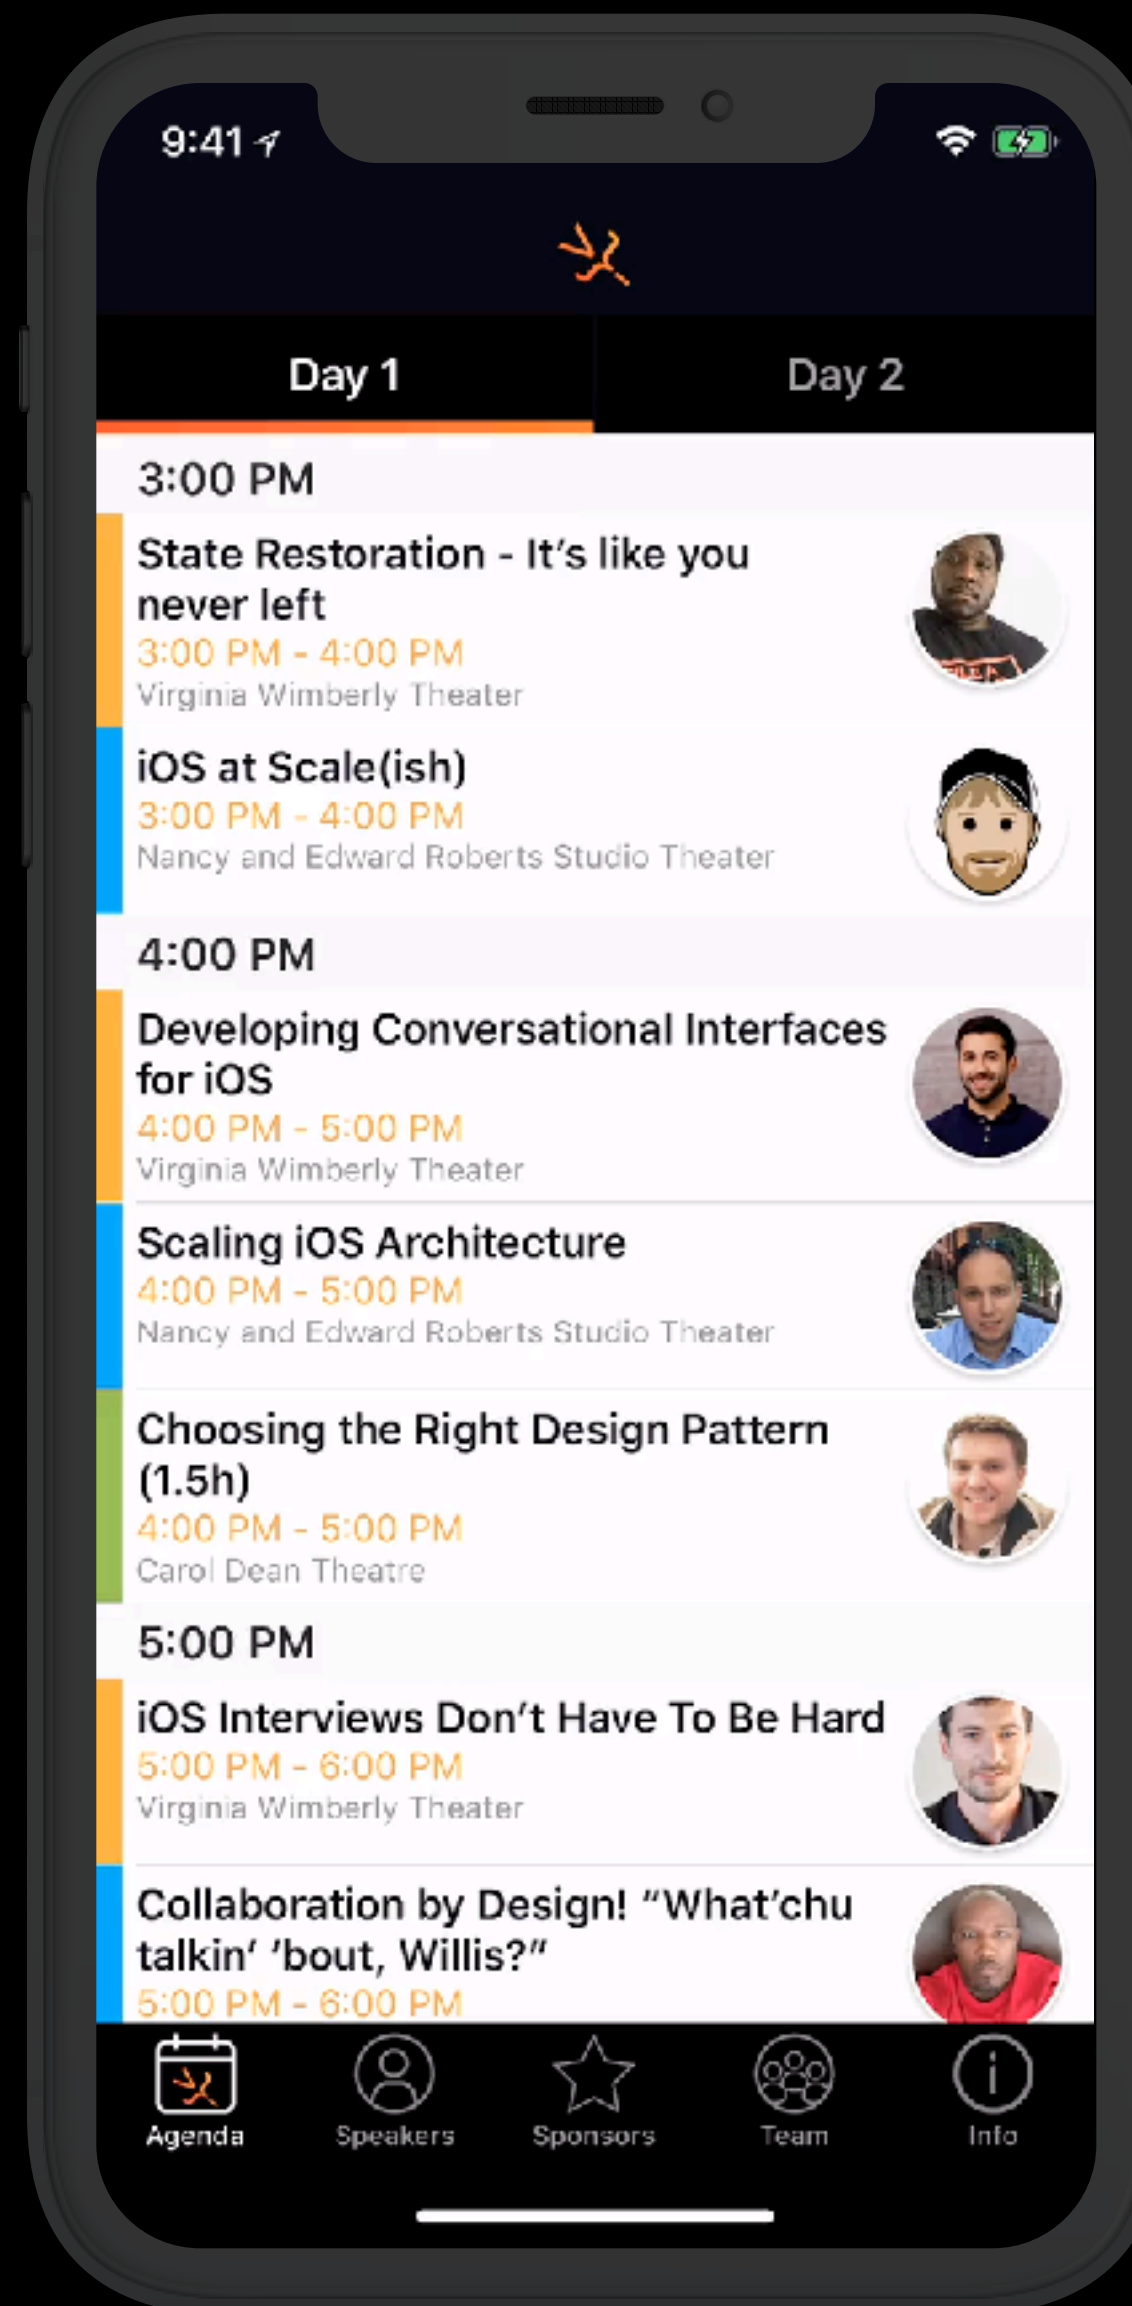

UITableView & UICollectionView

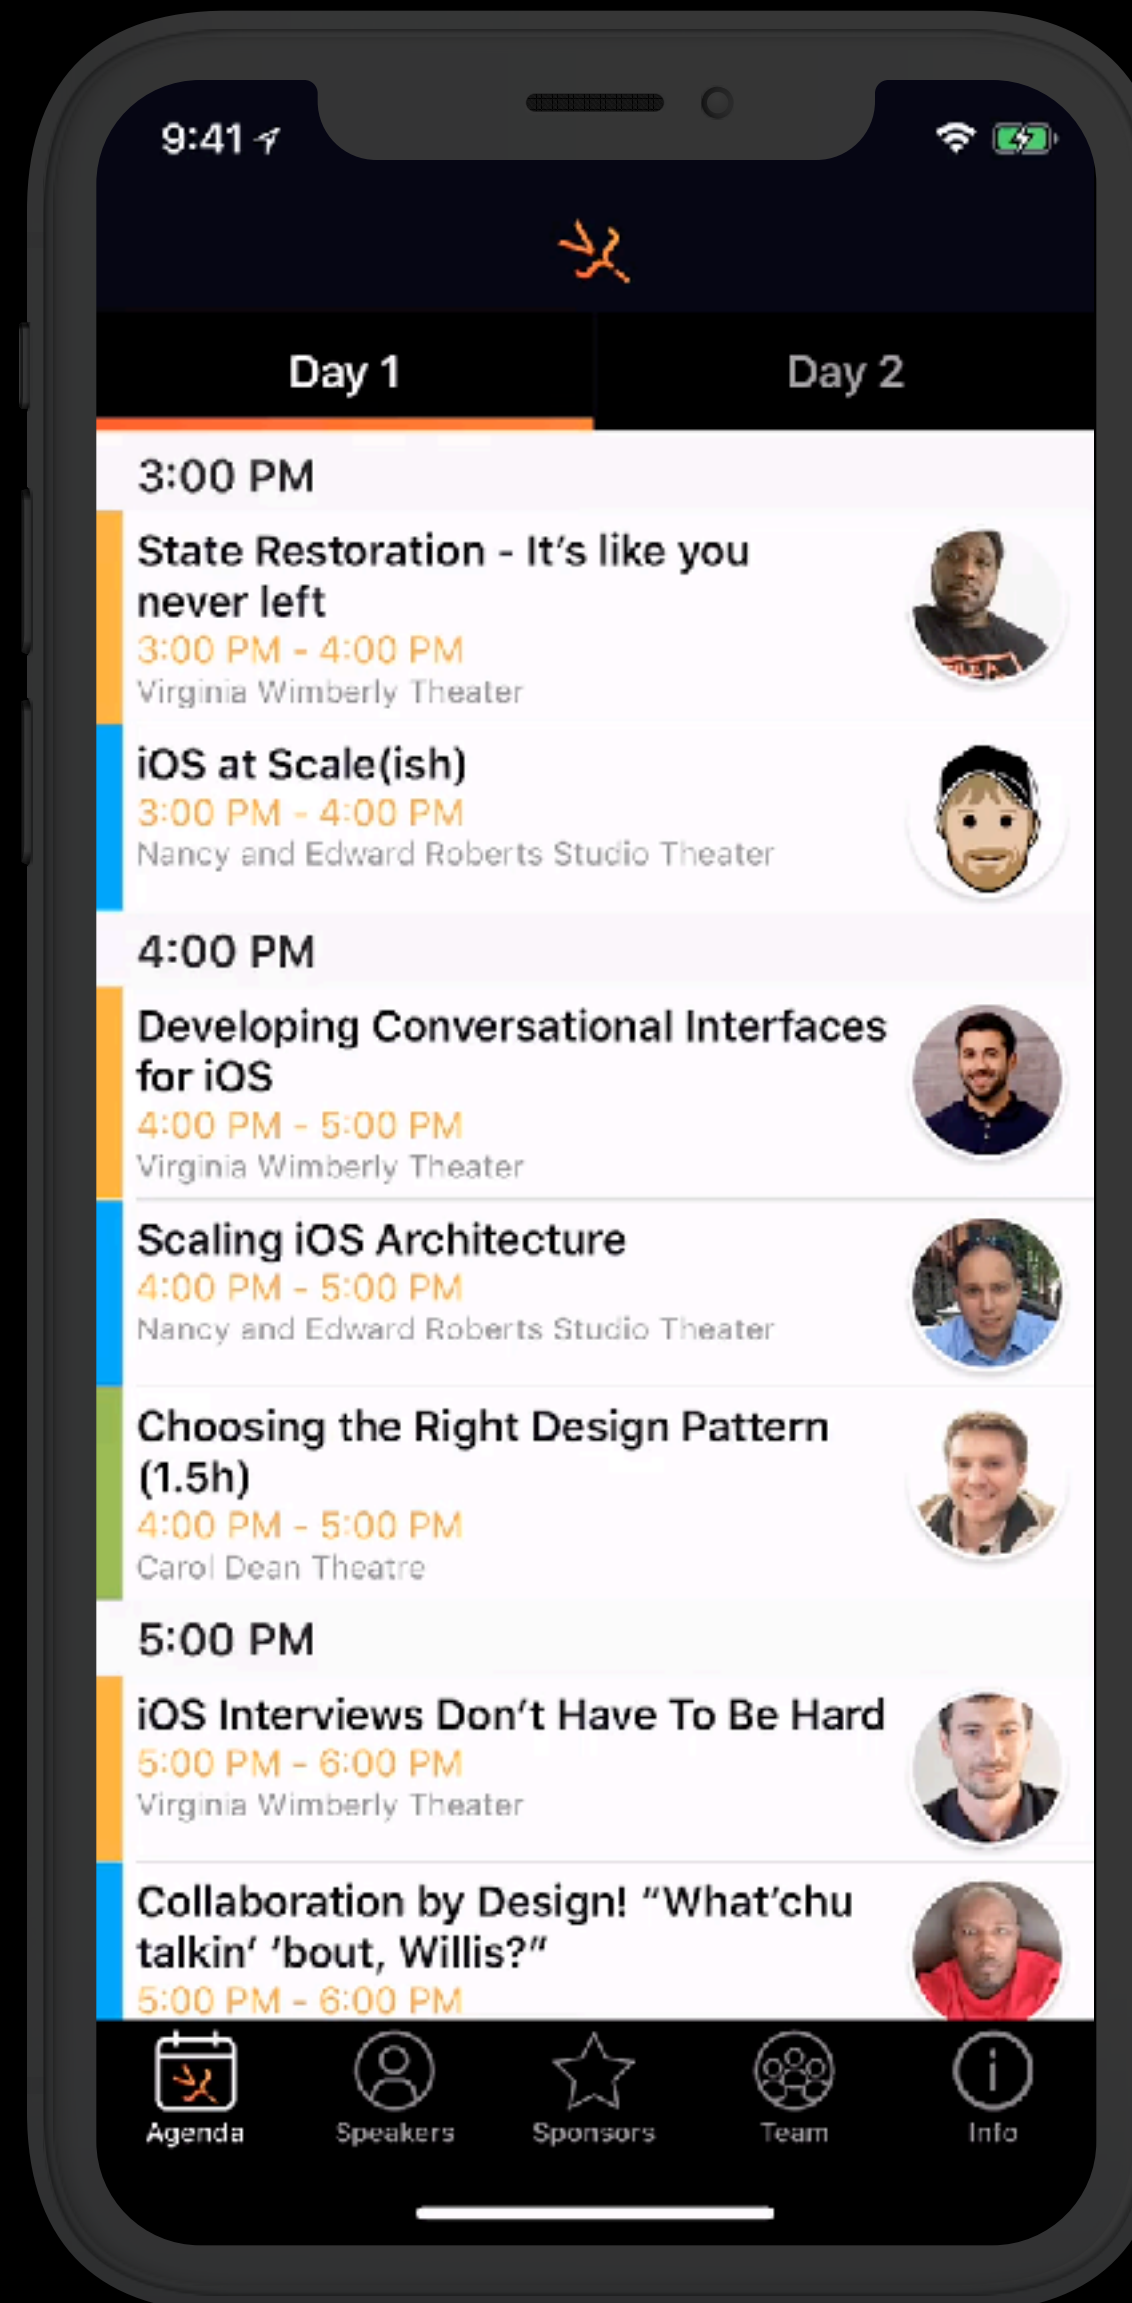

```
extension DaysTVC: UITableViewDataSourceModelAssociation {  
    func modelIdentifierForElement(at idx: IndexPath, in view: UIView) -> String? {  
    }  
  
    func indexPathForElement(withModelIdentifier identifier: String, in view: UIView) -> IndexPath? {  
    }  
}
```

Dynamic Modal

```
let story = UIStoryboard(name: "Main", bundle: nil)
guard let detail = story.instantiateViewController(withIdentifier: "detail") as? DetailVC else {return}
let nav = PeekABooNav(rootViewController: detail)
self.present(nav, animated: true, completion: nil)
```

What went wrong? 🤔

Dynamic Modal

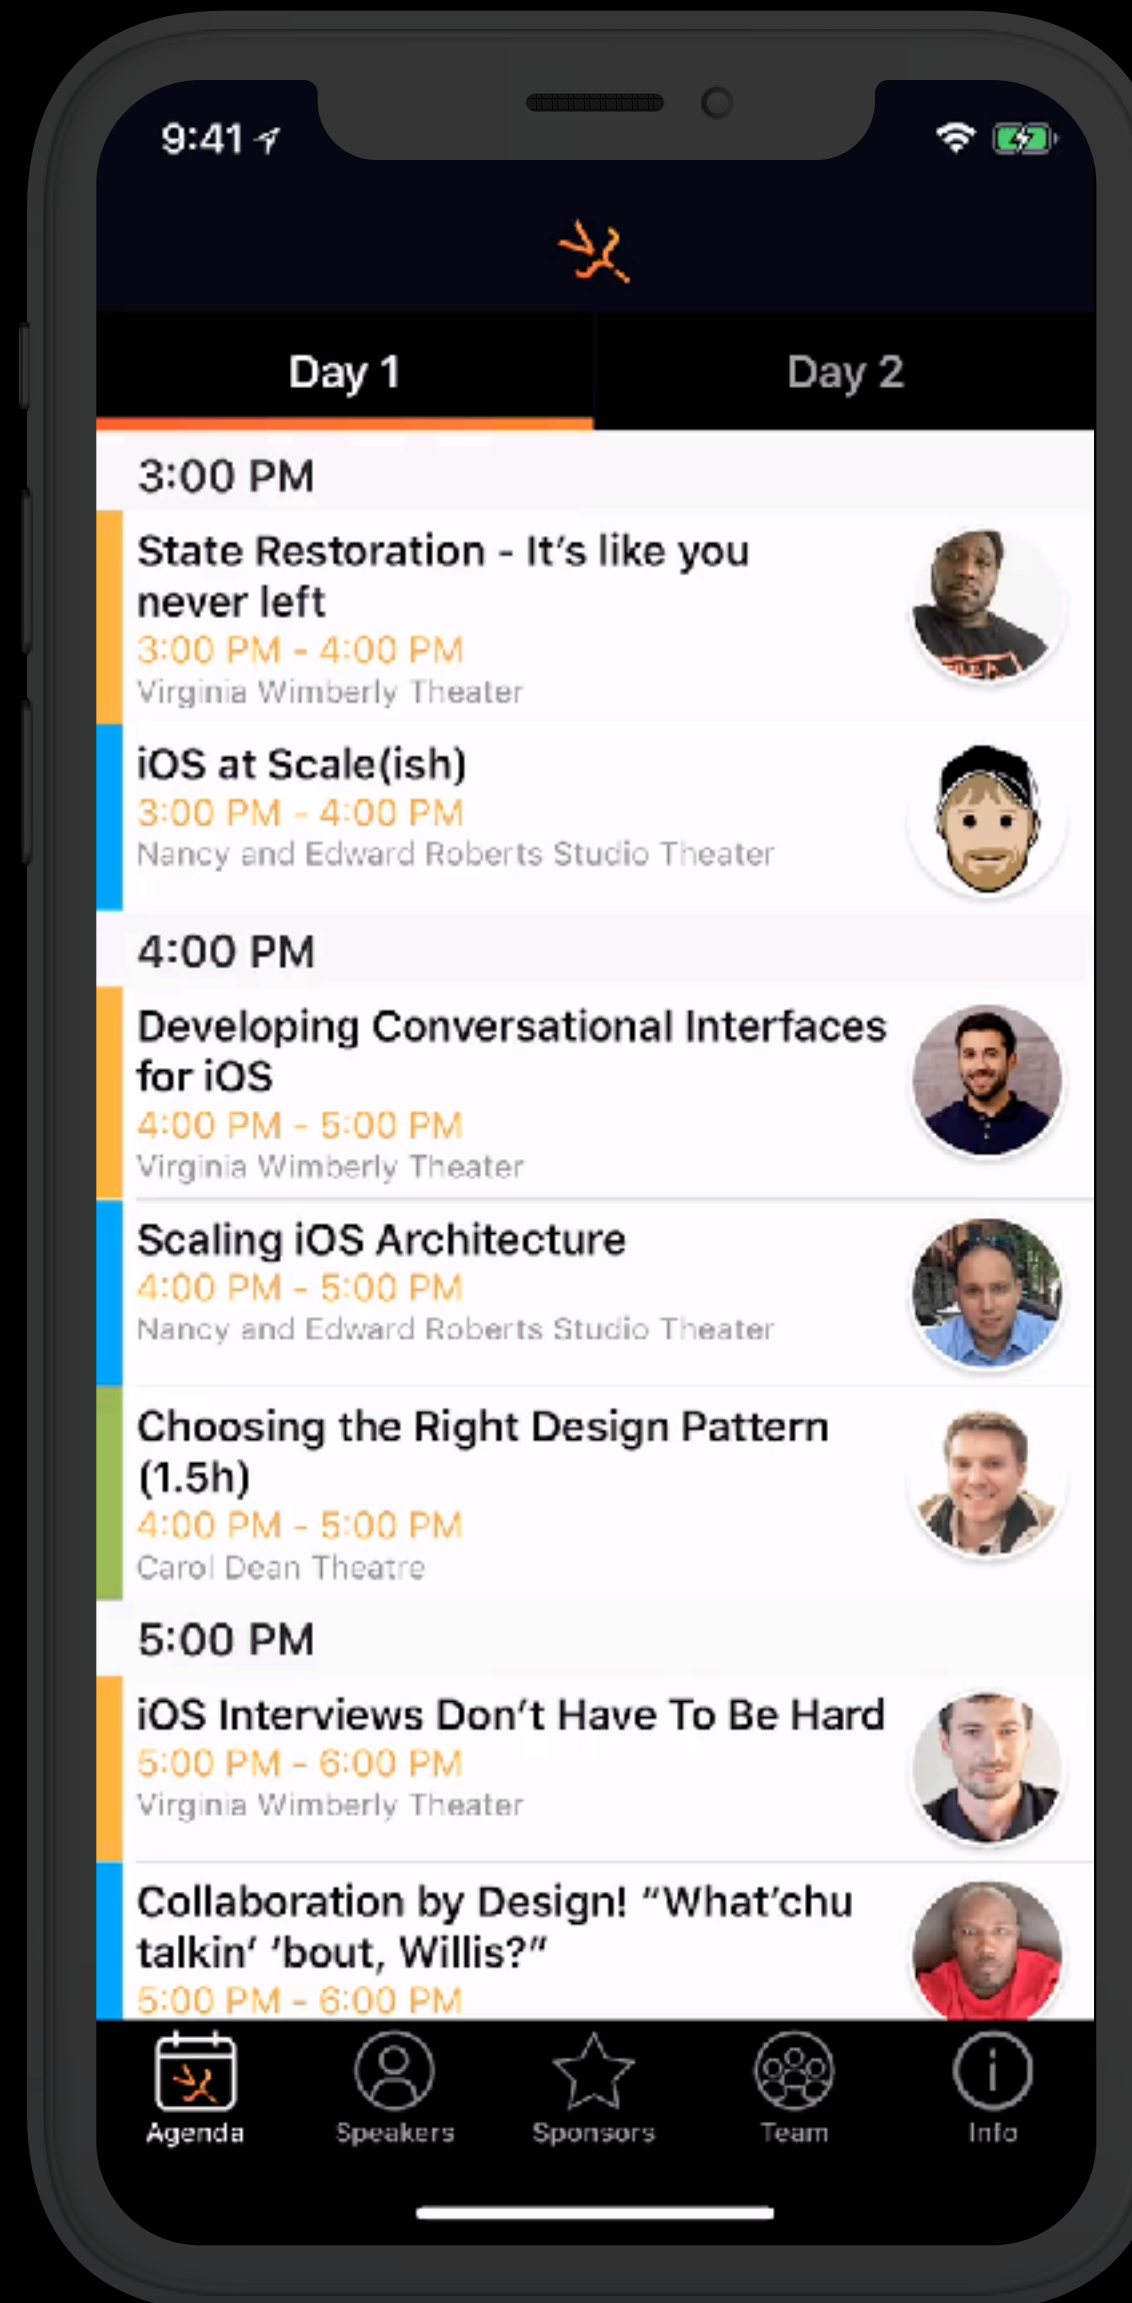

- Set restoration ID in code
- Add AppDelegate Method

Restoring View Controllers

AppDelegate.swift

```
func application(_ application: UIApplication, viewControllerWithRestorationIdentifierPath
identifierComponents: [String], coder: NSCoder) -> UIViewController? {
    guard let lastIdentifier = identifierComponents.last else {return nil}

    if lastIdentifier == "detailNav" {
        let nav = PeekABooNav()
        nav.restorationIdentifier = "detailNav"
        return nav
    }
    return nil
}
```

Opting Out Conditionally

Opting Out Conditionally

AppDelegate.swift

```
func application(_ application: UIApplication, shouldSaveApplicationState coder: NSCoder) -> Bool {  
    // Save the current app version to the archive.  
    coder.encode(1.0, forKey: "MyAppVersion")  
    // Always save state information.  
    return true  
}  
  
func application(_ application: UIApplication, shouldRestoreApplicationState coder: NSCoder) -> Bool {  
    // Restore the state only if the app version matches.  
    let version = coder.decodeFloat(forKey: "MyAppVersion")  
    if version == 1.0 {  
        return true  
    }  
    // Do not restore from old data.  
    return false  
}
```

Review

State Restoration *It's like you never left...*

#SwiftFest #StateRestoration @ishabazz 

Preserving UI State

Check for Opt-In

1

App Delegate

```
func application(_ application: UIApplication,  
shouldSaveApplicationState coder: NSCoder) -> Bool
```

Start App Preservation

2

App Delegate

```
func application(_ application: UIApplication,  
willEncodeRestorableStateWith coder: NSCoder)
```

Gather Restorable Objects

UIViewController or UIView Objects

`var restorationIdentifier: String?`

3

Encode Restorable Objects

UIViewController or UIView Objects

```
func encodeRestorableState(with coder: NSCoder)
```

4

Encode Restorable Objects

UIViewController Objects

```
var restorationClass: UIViewControllerRestoration.Type?
```

4

Load Initial UI

First App Initialization

2

App Delegate

```
func application(_ application: UIApplication,  
willFinishLaunchingWithOptions launchOptions:  
[UIApplication.LaunchOptionsKey : Any]? = nil) -> Bool
```

Is Restoration Supported?

3

App Delegate

```
func application(_ application: UIApplication,  
shouldRestoreApplicationState coder: NSCoder) -> Bool
```

Obtain View Controllers

App Delegate

```
func application(_ application: UIApplication,  
viewControllerWithRestorationIdentifierPath  
identifierComponents: [String], coder: NSCoder) ->  
    UIViewController?
```

4

Obtain View Controllers

Restoration Classes

```
func viewController(withRestorationIdentifierPath  
identifierComponents: [String], coder: NSCoder) ->  
    UIViewController?
```

4

Decode Restorable Objects

View Controller or View Object

```
func decodeRestorableState(with coder: NSCoder)
```

5

Finish Restoration

App Delegate

```
func application(_ application: UIApplication,  
didDecodeRestorableStateWith coder: NSCoder)
```

6

Finish App Initialization

App Delegate

```
func application(_ application: UIApplication,  
    didFinishLaunchingWithOptions launchOptions:  
    [UIApplication.LaunchOptionsKey : Any]? = nil) -> Bool
```
